Autism is a developmental disorder that is characterized by severe behavioral abnormalities across all <u>primary</u> areas of functioning. Its <u>onset</u> is often early; it generally makes itself known by the age of two and one-half. It is not a single disease entity but is instead a <u>syndrome</u> defined by patterns and characteristics of behavior; it, therefore, most likely has multiple <u>etiologies</u> rather than a single causative factor. Autism is not fully understood and thus is controversial with respect to diagnosis, etiology, and treatment strategies.

(P1) Most chromium compounds have brightly colored hues, and as a result <u>they</u> are widely used as coloring agents, or pigments, in paints. In addition to having a pleasing color a paint must protect the surface to which <u>it</u> is applied and be easy to apply in a thin, uniform coat.

(P2) All paints consist of two parts. One is a powder of solid particles <u>that</u> is the source of the color and the opaqueness and is known as the pigment. The other, called the binder, is the liquid into <u>which</u> the pigment is blended. The binder used in some paints is made from oily solvents such as <u>those</u> derived from petroleum resources. When applied, these solvents evaporate, leaving deposits of pigment on the surface.

6. The word they in paragraph 1 refers to……..
(A) chromium compounds (B) brightly colored hues (C) coloring agents (D) pigments
